

AT&T Secure Web Gateway

Comprehensive, unified protection for onsite and remote users

Surfing the web without a perimeter

The internet has become a vital tool in how workers access information and perform their job duties. Whether it be conducting research, placing orders, or marketing through social media, access to the web is indispensable. And while the internet is packed full of useful information and utility, it is also the platform for transmitting countless types of malware including viruses, worms, keyloggers, and ransomware.

Traditionally, organizations have addressed this risk by installing perimeter security devices such as firewalls at their data centers. But with applications moving to the cloud, the trend towards telecommuting, and bring your own device policies, fewer employees are connecting to VPN, thus bypassing those controls. Without guardrails, the possibility of a security incident becomes more likely as employees freely surf the net, click links, and download files without corporate visibility or policy enforcement.

The future of web security is in the cloud

For consistent protection across users, businesses should consider a cloud-delivered solution like AT&T Secure Web Gateway that does not rely on connection to the network for enforcement. This approach allows users to connect to cloud-based resources directly through the internet and is highly scalable as business needs change.

Potential benefits:

- Provides visibility into internet and web traffic for virtually all users, devices, and locations
- Helps protect users against viruses, ransomware, and other types of malware
- Enforces acceptable-use policies by restricting what sites users can visit
- Identifies devices that have been infected by malware or are acting as part of a botnet
- Blocks malware from unknown or zero-day threats using sandboxing technology*
- Performs SSL inspection of web traffic, removing the burden of decryption from firewalls*
- Integrates advanced capabilities, including cloud access security broker (CASB) and data loss prevention (DLP) into one centralized user interface*
- Offered as an AT&T managed service including deployment, security policy design, 24/7 monitoring and help desk support, processing of change requests, and implementation of approved security patches

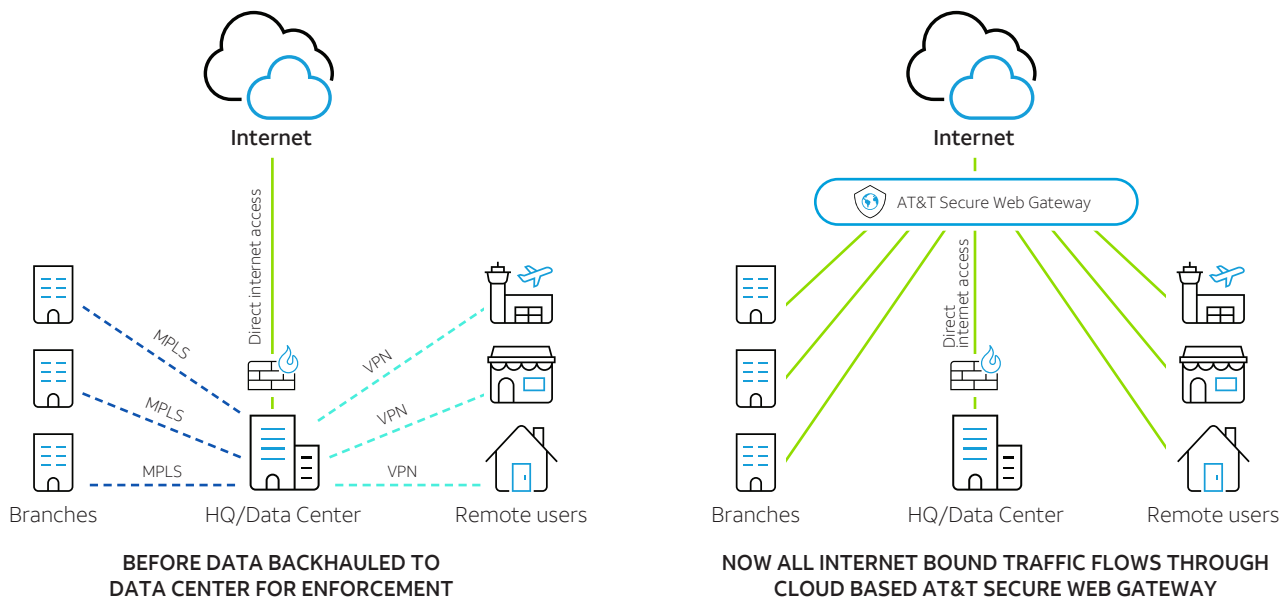

* Available options

Consistent and unified protection for virtually every user, device, and location

AT&T Secure Web Gateway is a managed solution from AT&T Business. It provides organizations with the ability to apply unified protection against web-based threats across users by restricting what sites they can access. Extending far beyond simple URL filters, it utilizes dozens of threat intelligence sources to protect users against the latest viruses, spyware, and other types of malware. Some editions also help protect against zero-day threats with sandboxing or DLP and CASB functionality in one converged platform.

In order to better protect the enterprise, it's crucial that all web traffic is analyzed for malware. This includes the majority of traffic now transmitted with SSL/TLS encryption. This has been a particular challenge to businesses in the past because of the extreme load that SSL inspection places on the firewall processor. AT&T Secure Web Gateway decrypts web traffic in the cloud, with minimal impact to performance. This allows administrators to remove that burden from firewalls so their bandwidth can be dedicated to their primary function of protecting the perimeter against inbound threats.

How it works

Because of its scalable, cloud-based architecture, AT&T Secure Web Gateway helps organizations transform their network to accommodate software as a service (SaaS) and cloud-based applications, and support a remote workforce. With this solution, administrators remain informed and have the ability to enforce consistent policy across users. In turn, employees use websites that are both safe and secure for the workplace.

About AT&T Cybersecurity

AT&T Cybersecurity helps reduce the complexity and cost of fighting cybercrime. Together, the power of the AT&T network, our Software-as-a-Service (SaaS)-based solutions with advanced technologies (including virtualization and actionable threat intelligence from AT&T Alien Labs and the Open Threat Exchange™), and our relationship with more than 40 best-of-breed vendors help accelerate your response to cybersecurity threats. Our experienced consultants and Security Operations Center (SOC) analysts help manage your network transformation to reduce cybersecurity risk and overcome the skills gap. Our mission is to be your trusted advisor on your journey to cybersecurity resiliency, making it safer for your business to innovate.
